Branes and <i>p</i> -form Potentials	Wrapping Rules	'Exotic Branes' and Mixed-symmetry Potentials	Summary and Open Issues
00000000	000000000	000000	000000

#### The Problem

## supergravity cannot accommodate T-duality !

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ → 圖 - 釣�?

## The 'good' sector

 there is no problem with the supergravity fields that describe physical degrees of freedom. In each dimension these fields are related to each other via dimensional reduction

• for instance, maximal supergravity describes 128 + 128degrees of freedom in each dimension  $D \le 11$ 

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

 Summary and Open Issues

 000000000
 00000000
 0000000
 000000

#### The 'bad' sector

• D-dimensional maximal supergravity also contains high-rank form potentials that do not describe physical degrees of freedom and that are not controlled by the representation theory of the supersymmetry algebra. The problem is that they are <u>not</u> related to each other via dimensional reduction

• <u>Key Example</u>: (D-1)-form potentials are 'dual' to an integration constant. These high-rank potentials couple to domain walls.

Wrapping Rules

'Exotic Branes' and Mixed-symmetry Potentials

Summary and Open Issues

#### Branes

Branes are extended objects with a number of worldvolume and transverse directions. They are an essential part of (non-perturbative) string theory

- The NS-NS 2-form B<sub>2</sub> suggests a half-supersymmetric string
- The 3-form  $C_3$  of 11D sugra couples to a half-susy M2-brane

#### $sugra \ potential \leftrightarrow half-supersymmetric \ brane$

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Does it always work as simple as that?

#### Strings and T-duality

The T-duality group in D dimensions is SO(d,d;  $\mathbb{Z}$ ) with d = 10 - D

The D-dimensional string couples to the NS-NS 2-form  $B_2$  as well as 1-forms  $B_{1,A}$  (A = 1, ..., 2d) that transform as a vector under T-duality

To construct a gauge-invariant WZ term

$$\mathcal{L}_{\mathsf{WZ}}(D < 10) = B_2 + \eta^{AB} \mathcal{F}_{\mathbf{1}, \mathbf{A}} B_{\mathbf{1}, B}$$

we need to introduce 'extra scalars'  $b_{0,A}$  via  $\mathcal{F}_{1,A} = d b_{0,A} + B_{1,A}$

#### Counting the Bosonic Worldvolume D.O.F.

$$D = 10$$
 :  $(10 - 2) = 8$ ,  
 $D < 10$  :  $(D - 2) + 2(10 - D) \neq 8!$ 

Twice too many 'extra scalars'  $b_{0,A} \rightarrow$  'doubled geometry' Hull, Reid-Edwards (2006-2008)

Self-duality conditions on the extra scalars  $b_{0,A}$  give correct counting

## 'Wess-Zumino term requirement'

the construction of a gauge-invariant WZ term may require, besides the embedding coordinates, the introduction of a number of extra worldvolume p-form potentials

worldvolume supersymmetry requires that these worldvolume fields fit into a multiplet with 16 supercharges

Does the 'WZ term requirement' always lead to the rule that

#### potential $\Leftrightarrow$ half-susy brane?

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

## Input from Supergravity

• The T-duality representations of all high-rank form potentials have been determined using three different techniques:

• closure of the supersymmetry algebra

de Roo, Hartong, Howe, Kerstan, Ortín, Riccioni + E.B. (2005-2010)

• using the embedding tensor technique

for a review, see de Wit, Nicolai, Samtleben (2008)

• using the very extended Kac-Moody algebra  $E_{11}$ 

West (2001); Riccioni, West (2007); Nutma + E.B. (2007)

#### Question

given a (p + 1)-form potential which (components of its) T-duality repres. couple to a half-supersymmetric brane?

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

## A scaling symmetry

All potentials transform as a representation of the T-duality group O(d,d) and scale under a scaling symmetry

The scaling weight  $\alpha$  determines the dependence of the brane tension T on the string coupling constant  $g_s$  via

 $T \sim (g_s)^{\alpha}$ 

This scaling weight is invariant under dimensional reduction

Summary and Open Issues

## **T-duality**

• At the level of (linearized) supergravity T-duality can be recovered by assuming that these theories can be extended with a set of mixed-symmetry potentials with an underlying E<sub>11</sub>-symmetry

 To recover T-duality at the level of branes we assume that these mixed symmetry potentials are in one to one correspondence with extended objects called 'exotic branes'. They have worldvolume, transverse and special isometry directions

see, e.g., Obers, Pioline (1999); Lozano-Tellechea, Ortín (2001)

see also work by de Boer and Shigemori (2010, 2012)  $\rightarrow$  'T-folds'
